

Four transferable SLM computations — evidence tiers kept explicit

1 Source-tagged credit

SOE: Active / Passive / Unrewarded credit; JAWS selectively disrupts Active-belief update.

External: rat demonstrator > moving-object source; macaque source-aware state.

Neural/status: primate self/other RPE remains literature/audit support pending non-circular validation.

2 State-gated information value

SOE: value of social evidence depends on observer state and current action opportunity.

External: cooperative role $\times$ uncertainty; Aeon recent-partner history.

Neural/status: marmoset partner variability changes evidence accumulation in both recorded animals.

3 Task-matched multiscale state

SOE: immediate switching + minute-scale history + transient cross-day prior.

External: Human Feature-Q 8/10; Rat classical-RL 8/10; macaque Feature-Q sensitivity 41/44 nested dates

Neural/status: macaque ACC gains from multiscale state; macaque inference remains nested in 2 monkeys.

4 Sampling-to-action separation

SOE: Observe policy $\rightarrow$ sampled demonstrator content $\rightarrow$ short-latency Feed conversion.

External: marmoset gaze gates partner evidence before decision; rat observed source predicts later choice.

Neural/status: marmoset dmPFC is an architectural analogue, not a full two-policy replication.
